RUNBOOK

Git wasn't built for AI agents writing code

Anthropic just redesigned source control around Claude Code, not humans

WHAT'S HAPPENING

Anthropic is rebuilding dev tooling for agents

A recent engineering writeup is generating heavy technical discussion

- Core focus: how agents read, write, reason about code
- Agents interact with repos differently than humans do
- Sparked fast, high-volume discussion among engineers

WHY IT MATTERS

This isn't a wrapper on existing tools

It signals agent-native infrastructure as its own discipline

- Most "AI dev tools" bolt AI onto human workflows
- This rebuilds the workflow around agent behavior first
- A sign of where serious Claude Code tooling is heading

THE MECHANISM

Humans and agents read code differently

That difference is the whole design problem

- Humans scan diffs visually and hold context in memory
- Agents need structured, explicit, machine-parseable state
- Traditional git history assumes a human reviewer

THE MECHANISM

Agents need different commit granularity

How changes get tracked shapes how agents reason

- Human commits bundle intent across many files
- Agents benefit from finer, more traceable change units
- Clearer history helps agents self-correct mistakes

THE MECHANISM

Context, not just code, needs versioning

Agents rely on more than the final diff to work well

- Reasoning traces and intent matter as much as the change
- Source control becomes a memory layer, not just storage
- This is where agent-native infra diverges from classic git

LESSON

Agent-native infra is now a real discipline

Expect more core tools to get rebuilt, not just wrapped

- CI, testing, and docs may need the same rethink
- Teams using Claude Code should watch this space closely
- Wrapping old tools in AI is a short-term patch, not a system

TAKEAWAY

Audit your stack for agent-readability

Start treating your workflows as something agents must parse

- Ask: can an agent trace why a change was made, not just what
- Look for tools that expose structure, not just output
- Build workflows agents can reason about, not just execute

CTA

What would you rebuild for agents first?

I think about this exact problem when building agent workflows
