HOOK

# Claude Code just stopped being fixed software

You can now reshape how it behaves in plain English

- No code required to change its behavior
- Multiple dev creators flagged this in the same week
- Bigger signal than the feature itself

WHAT IT IS

# What Claude Code mods actually are

A new layer that sits on top of the base tool

- Plain-English instructions adjust default behavior
- No custom scripting or plugin code needed
- Framed by creators as the biggest shift since Skills

WHY NOW

# Why this is spreading right now

Three separate breakdowns in under 56 hours

- Independent creators, same observation, fast timing
- Strong view velocity across all three
- Pattern, not a single creator's hype cycle

MECHANISM

# The real shift: tool becomes platform

Fixed products don't let you redefine behavior

- Configurability turns a tool into infrastructure
- Teams shape it around their workflow, not vice versa
- This is the same pattern seen with Skills earlier

LESSON 1

# Instructions are becoming the interface

Less code, more specification of intent

- Behavior changes live in instructions, not forks
- Easier to iterate, easier to hand off to teammates
- Lower barrier for non-engineers to adjust it too

LESSON 2

# Durable workflows beat clever prompts

One-off prompt tricks don't survive tool updates

- Configuration layers persist across sessions
- Treat setup as infrastructure, not a one-time hack
- Document what you configure and why

LESSON 3

# This pattern will repeat across AI dev tools

Skills, then mods, then whatever comes next

- Agentic tools keep adding configurable layers
- Early adopters build habits that compound over time
- Watching the pattern matters more than any one feature

TAKEAWAY

# Treat your dev tools as platforms, not defaults

The usable shift to make this week

- Audit what you currently configure vs. accept as-is
- Write down behavior changes so they're repeatable
- Revisit configs every time the tool adds a new layer

CTA

# What's the first thing you'd reconfigure?

Curious how teams are actually using this layer

- Drop your use case below
- Happy to compare notes on setups
