HOOK

Claude Code just stopped being a fixed tool

Developers can now rewrite how it behaves, mid-call

- No waiting on Anthropic's roadmap for this one
- Guardrails and features become your call, not theirs

WHAT IT IS

Mods intercept tool calls before they run

Plain-English JS/TS that sits between intent and action

- Can modify, block, or redirect a tool call
- Can render custom UI panels inside the session
- Turns Claude Code into a programmable environment

WHY IT'S BLOWING UP

Three breakdowns, one weekend, same conclusion

Creators are calling it the biggest shift since Skills

- Multiple independent threads converged within 48 hours
- High comment volume signals real builder interest
- Signals a shift from using the tool to shaping it

MECHANISM

The call gets a checkpoint, not a green light

Every tool call now has a place to inspect it first

- Mod sees the proposed action before execution
- Logic decides: allow, alter, or stop
- Custom UI can surface context mid-decision

WHY THIS MATTERS

Guardrails move from policy docs to code

Rules you used to write in Slack now run automatically

- Enforce standards without trusting memory or docs
- Stop risky actions before they touch a system
- Add team-specific logic without forking the tool

PRACTICAL PATTERN

Start with one risky action, not everything

Mods are easiest to trust when scoped narrowly

- Pick a single high-risk tool call to intercept first
- Log what the mod would have blocked, before blocking
- Expand scope once the logic proves reliable

LESSON

Programmability beats waiting for features

The teams adapting fastest aren't the most advanced

- They're the ones willing to write the missing piece
- Platform gaps become code, not support tickets

TAKEAWAY

Treat Claude Code like infrastructure, not an app

Infrastructure gets customized; apps get requested

- Map which tool calls in your workflow need a checkpoint
- Design the guardrail before you need it, not after

CTA

What would you intercept first?

Curious which tool call in your workflow needs a guardrail

- Tell me the workflow and I'll point to the checkpoint
